

# Four-Season Growing in Wisconsin

Let's look at some ideas for growing year round in Wisconsin. These can be as simple as insulated covers for cold-hardy greens to in-ground greenhouses with passive and active heating.

Focus on CROPS for WINTER GROWING

*Johnny's Winter Growing Guide*

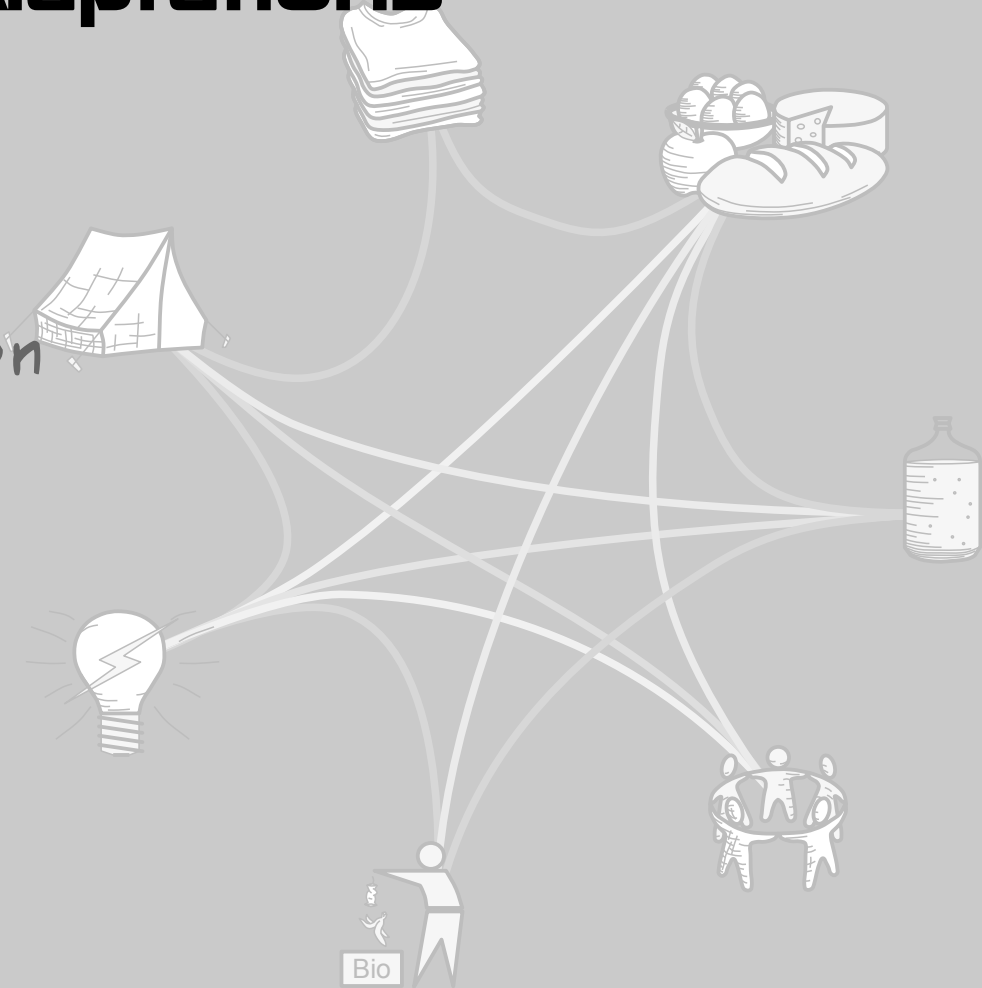

Ranked by Reliability for Winter Growing Success

Feedback received from northern growers has provided a ranking of crops proven successful for winter growing regionally. In order of popularity and degree of reliability, these crops fall into 3 tiers. Hardiness, adaptability to winter growing, and quality and quantity at harvest time also factor into the ranking.

| TIER 1<br>MOST RELIABLY SUCCESSFUL   | TIER 2<br>SECOND MOST DEPENDABLE  | TIER 3<br>MORE CHALLENGING   |

- General Variety Selection
- Specific Varieties
  - Available as handout.

- Beets, 15-20°F: Winterkeeper, Lutz, Rouschka, Albino, Chioggia
- Broccoli, 15°F: purple sprouting, nine star perennial
- Brussels Sprouts, 0-10°F: Long Island improved, Roodnerf, Rubine, Red Ball
- Cabbage, 25°F: Landgedijker, Glory of Enkhuizen, Christmas Drumhead, Rodyna, Kappertjes, Ormskirk, January King, Early Jersey, Tete Noir.
- Carrots, 15°F: Nantes
- Cauliflower, 32°F: English winters, Walcherines, Armado.
- Chinese Cabbage, 25°F:
- Collards, 0-10°F: Vates, Champion, Georgia, Cabbage
- Kale, 10-15°F: Tall Scotch, semi-dwarf, Tall Curled, Cottagers, Thousand-Head, Tuscan.
- Kohlrabi, 10°F: Purple Vienna, Vienna, Superschmeltz
- Leeks, 20°F: Carentan, Blue de Solaise.
- Lettuce, 10-20°F: Oakleaf, Prizehead, Kwiek, Marvel of Four Seasons, Rouge d'Hiver, Pirat, Red Montpellier, Winter Density, Blushed Butter Oak, Little Gem.
- Mache/Corn Salad, 0°F:
- Mustard, 25°F: Pak/Bok Choy, Green Wave, Tendergreen, Santoh Filled
- Radish, 10°F: China Rose, Black Spanish, Daikon
- Rutabaga, 15°F: Laurentian.
- Spinach, 20°F: Cold-resistant Savoy, Giant Winter, Winter Bloomsdale
- Swish Chard, 20°F:
- Turnip, 10-15°F: Golden Ball, Orange Jelly, Golden Perfection.

# BENEFITS OF USING MULCH

2" to 3" of Mulch

## Nourishes Soil

As ORGANIC mulch decomposes, it nourishes your soil and feeds your plants. This happens over time.

## Suppresses Weeds

Mulch cuts weed seeds off from sunlight. This prevents them from growing enough to break through the surface.

## Conserves Water

Mulch helps soil retain moisture. This lowers the amount of watering needed in your plant bed.

## Regulates Temperature

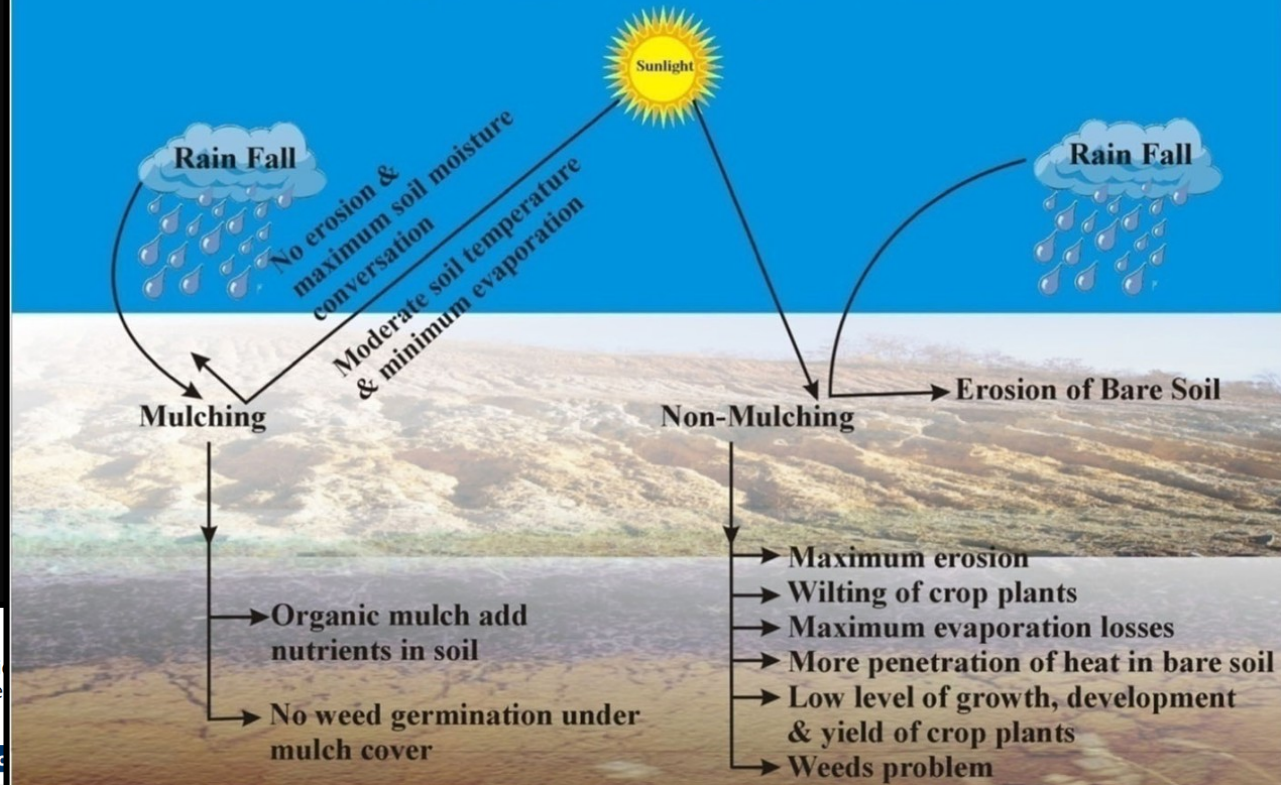

Mulch insulates your plants' root systems against the sun and extreme temperature variations.

## Prevents Erosion

Mulch acts as the first defense against nature's elements that threaten to wear away your soil.

## Working of Mulch Materials Kept at Soil Surface

## Potential agricultural and environmental benefits of mulches—a review

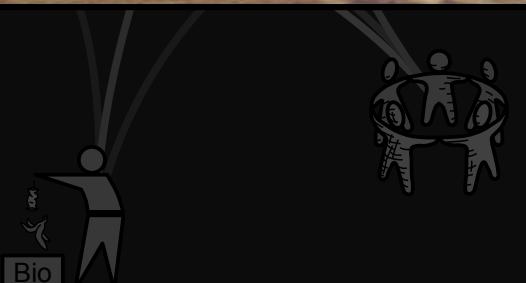

Rashid Iqbal<sup>1</sup>, Muhammad Aown Sammar Raza<sup>1\*</sup>, Mohammad Valipour<sup>2</sup>, Muhammad Farrukh Saleem<sup>3</sup>, Muhammad Saqlain Zaheer<sup>1</sup>, Salman Ahmad<sup>1</sup>, Monika Toleikiene<sup>2</sup>, Imran Haider<sup>1</sup>, Muhammad Usman Aslam<sup>1</sup> and Muhammad Adnan Nazar<sup>1</sup>

### Abstract

Rapid industrialization and urbanization have resulted in elevated global temperature over the years consequently disturbing the balance of agro-ecological systems worldwide. Therefore, new eco-friendly agricultural practices for sustainable food production are needed. Mulching could potentially serve the purpose by reducing soil evaporation, conserving moisture, controlling soil temperature, reducing weed growth, and improving microbial

CAROL OBERTON

Cold air is blocked by tight fence and trapped in garden.

Cold air flows through open fence or hedge.

A solid barrier yields a sheltered area 8 times the height of the barrier but increases turbulence.

A 40 percent permeable barrier yields a sheltered area 16 times the height of the barrier.

Sow seeds during this time period. See cultural information in the catalog.

Transplant: These seedlings benefit from transplanting. Move at six weeks to a permanent well-limed location.

Covering or cloching these varieties will lengthen the harvest period.

## Earthbag Walipini Greenhouse – 1.0 (Test Design)

TEL: 608 . 886 . 9584  
EMAIL: [LOWTECHINSTITUTE@GMAIL.COM](mailto:LOWTECHINSTITUTE@GMAIL.COM)  
WEB: [LOWTECHINSTITUTE.ORG](http://LOWTECHINSTITUTE.ORG)

This greenhouse is partially buried and oriented to catch the sun. The thermal mass of the bermed earth and earthbags will provide thermal inertia, evening out temperature fluctuations and allowing a longer growing season than an above-ground greenhouse. The earthbags are reclaimed from local breweries and filled with on-site clay, straw, and hydrated lime. The walls are curved to absorb lateral pressure from the bermed earth and protected by a double moisture barrier: exterior plastic sheeting and internal plastic bags within the earth bags. The roof is double layered.

PUTAH CREEK AMPHITHEATRE  
PERSPECTIVE VIEW

DESIGN INTENT:

THIS FORMAL, EDUCATIONAL AMPHITHEATRE IS DESIGNED AS A NATURAL SITE THAT IMITATES SLABS OF ROCK REVEALED BENEATH THE EXISTING SOIL. THE SITE FUNCTIONS AS AN ENTRANCE TO THE ARBORETUM BY ATTRACTING AND GUIDING PEOPLE THROUGH SMALLER EXHIBITS OF EDIBLE AND FRAGRANT VEGETATION.

PLANT LEGEND:

EDIBLE FRUIT PLANTING AREA:  
PINEAPPLE GUAVA, FIG,  
STRAWBERRY, KUMQUAT,  
AND OTHER FRUIT TREES

FRAGRANT PLANTING AREA:  
JEFFERY PINE, HYBRID TEA  
OLIVE, WINTER  
HONEY SUCCULENTS

A solid barrier yields a sheltered area 8 times the height of the barrier but increases turbulence.

A 40 percent permeable barrier yields a sheltered area 16 times the height of the barrier.

# Chinese Greenhouse Design for Winter Gardening

By Kris De Decker

*This woman is able to grow vegetables long into the winter in her passive solar greenhouse located in Ladakh, India, even when the outside temperature falls to negative 13 degrees Fahrenheit.*

*Unlock the sun's full potential with passive solar greenhouse designs for an energy-efficient Chinese greenhouse design to grow warm-season plants year-round with little to no extra heating.*

[Home](#) > [Fruit and vegetable farming](#) > [Growing systems](#) > Deep Win

### Farm-scale deep winter greenhouse partnership opportunity

RSDP is seeking applications from farmers in each of the five RSDP regions in Greater Minnesota to partner in the development of a farm-scale deep winter greenhouse (FSDWG). Farmer partners will be selected through a competitive process to build a UMN-designed FSDWG and will receive \$25,000 toward their commitment and partnership on research, outreach and educational activities over the next three years.

Farmers located in Greater Minnesota are eligible. (The 11 metro counties of Hennepin, Ramsey, Scott, Carver, Dakota, Washington, Anoka, Isanti, Chisago, Wright and Sherburne are excluded at this time).

The drawing includes a plan view at the top left showing an oval interior with a 6" gravel drainage ring, a 21" x 16" x 5" tamped earth bag wall, and a cold sink. A cross-section of the wall shows 'header/eave plug earthbags', an 'outer poly layer', and an 'inner glass layer' with a 'gutter'. A cross-section of the roof shows 'Summer' and 'Winter' orientations, 'corrugated clear poly' with '2" x 4" rafters @ 24" OC', and an 'inner glass layer'. A detail of the wall shows 'earthbags with 5 percent hydrated lime + 50 percent clay and 45 percent straw w/ courses connected by barbed wire' and 'drainage gravel' at the base.

## Walipini Earthbag Greenhouse — Foundation and Bags

Posted on November 6, 2017 by lowtechinstitute

We've been working hard on the earthbag walipini greenhouse. Although our weekend workshop got rained out, we've still managed to get the foundation trenches dug, the rubble trench poured in, and the first layer of bags laid. Here's the details.

### Foundation

In all, we've excavated approximately 48 tons of soil. This has taken about 40 hours of work. Each trench is about 2 ft wide. The outside wall is 3 ft 6 in deep. The slightly lower cold sink area is 4 ft 6 in deep. Each trench bottom is filled with 6 in of gravel for drainage and a perforated 4-in drainage pipe around the exterior.

## Walipini Update

Posted on December 18, 2019 by lowtechinstitute

It has been a while since I've written about the walipini, but it has been getting steady work over the last year. A walipini is an in-ground greenhouse. It uses the thermal mass of the earth to help keep its internal temperature from fluctuating too quickly in the winter. It is essentially a pit with a retaining wall of earthbags (which I call "engineered sand bags" full of clay, hydrated lime, and straw and/or woodchips, at a 7:1:2 ratio, held together by barbed wire between the layers) with a post-supported roof over it.

For those who want a quick refresher, check out [this post describing the planning](#).

## Greenhouse in the Snow

## Greenhouse in the Snow Geothermal Greenhouse Kit

### Geothermal Greenhouse Kit

-  All kits are 17' wide
-  The smallest kit offered is 54' long & we increase in 6' increments in length
-  96' and 102' long are the most efficient sizes

**\$199/lineal foot**

## Cross Members & Attachments for Engineered Retaining Wall

### Engineered Retaining Wall Sets

-  Set includes cross member & two hangers to attach them to retaining wall posts
-  Cross members offered in bare steel or galvanized steel
-  Composite and wood posts (as pictured) are not included

**\$119.58/set for Non-Galvanized**  
**\$132.25/set for Galvanized**

\*NOTE: Does not include shipping. Shipping is calculated at time of shipment.

## "LIVING LIGHTLY ON THE EARTH"

Building an Ark for Prince Edward Island, 1974-76

Steven Mannell

## The PEI Ark Catalogue

## "Living lightly on the earth:" building an Ark for Prince Edward Island, 1974-76

Built in 1976 by Solsearch Architects and the New Alchemy Institute as "an early exploration in weaving together the sun, wind, biology and architecture for the benefit of humanity," the PEI Ark was conceived as a "bioshelter" integrating ecological design features to provide autonomous life support for a family. Opening day mixed counterculture together with official culture: Prime Minister Pierre Trudeau, Premier Alex Campbell, Whole Earth Catalog compiler Stewart Brand, and hundreds from PEI's counterculture settlements, and the neighboring traditional communities. Thousands more would visit the Ark over its short life. This website, along with the accompanying book and exhibition, explores the story of the Ark for PEI, and its architectural vision of life led in collaboration with nature.

The **PEI Ark Catalogue** offers a selection of documents and research materials about the Ark – its conception, development, and operation – along with stories about the research process. It also offers the opportunity for anyone who experienced the Ark to share their stories, photographs, and other materials, through the "[Share Your Story](#)" page and the gallery. We invite you to take part in celebrating the 40th anniversary of this visionary project.

**Exhibition:** October 2016 – April 2017 at the Confederation Centre Art Gallery, Charlottetown PE; September – December 2019 at the Beaverbrook Art Gallery, Fredericton NB; **04 March – 17 April 2022 at the Dalhousie Art Gallery, Halifax NS.**

CAPE COD

## The Cape Cod Ark

BY ELISE HUGUS / PHOTOGRAPHY BY DANIEL COJANU | DECEMBER 16, 2014

### A Study in Self-Sufficiency

The snow is shin deep, the mercury well below freezing. In the stunning clarity of winter sunshine, a complex triangle of glass rises from among the dazzling white drifts. A layer of condensation obscures the details of the verdant world inside, but as I draw closer, the green takes shape: a forest of kale, hanging baskets of alyssum, beguiling arch of pole beans. Hyacinths float atop vats of greenish water, as catfish swim in lazy circles.

In contrast with the cold, white world I just stepped out of, this winter landscape feels like paradise. As I quickly shed layers, my muscles release their frigid tension and my face relaxes into a smile. The air is humid, teeming with the sweet smell of soil, of respiring plants, of life. I take a seat at a table next to a sandbox filled with toys. A faint

The Cape Cod Ark is a solar greenhouse developed by the New Alchemy Institute to grow fresh food in the winter without fossil fuels. It grows salad greens and vegetables in soil beds and grows fish and lettuce in aquaponics ponds. The Ark is attached to an energy-efficient and nutrient recycling house and provides a model for ecological living in a post-petroleum future. These ideas for a single-family home hav ...more

## Full-Circle Compost System

Low Technology Institute / S. Johnson

- 4 Plants enjoy an environment rich in  $CO_2$ ,  $NO_3$ ,  $H_2O$ , and **HEAT** directly in their grow bed.
- 6  $NH_3$  is converted to  $NO_3$  in a biofilter.
- 7  $CO_2$ ,  $NH_3$ ,  $H_2O$ , and **HEAT** are given off.
- 1 Blower pumps  $O_2$  into the compost as it breaks down.

This modular system was tested at the Low Technology Institute from 2021-23.

- |                     |   |                       |   |
|---------------------|---|-----------------------|---|
| 1. Blower           | Draws in air, a minute each hour.                                 | 8. Drain Tile         | Accepts compost off-gasses and transmits it to grow beds.               |
| 2. PVC Piping       | Distributes air from blower; acts as plenum.                      | 9. Woodchip Biofilter | Distributes air and holds nitrogen-friendly bacteria.                   |
| 3. Woodchip Beds    | Distributes air from pipes.                                       | 10. Grow Beds         | Holds plants, which benefit from heat, moisture, and $CO_2$ from below. |
| 4. Pallet Bins      | Holds compost feedstock.  |                       |   |
| 5. Perforated Pipes | Exhausts gasses from compost pile.                                |                       |   |
| 6. Compost          | Provides organic materials to create heat, moisture, and $CO_2$ . |                       |   |
| 7. Bladder          | Impermeable tarp captures compost off-gasses                      |                       |   |
